

Reducing cost while maintaining reliability through innovative technology

Searching for ways to reduce expenses and inventory while maintaining plant reliability? Don't feel alone. In today's demanding environment, that is a universal challenge. Join us as we present solutions that not only address these issues but more, including reduced delivery and outage times. By embracing leading-edge technology breakthroughs, your plant will perform more effectively and efficiently.

Our recommendations emanate from a rigorous analysis of the industry. We carefully studied current standard industry practices with respect to valve repair, planning and execution. OEM pricing, delivery and the quality of replacement valve parts was also evaluated. We compared advances in current technology to those applied ten years ago. Critical to our recommendations was a review of other industries and their embrace of and success with new technology. Finally, and most importantly, we listened to you, the customer.

Make decisions based on your plant's needs and not on the delivery schedule or availability of parts from the OEM. We listened as you spoke of greater predictability and flexibility for planned outages. By embracing innovative technologies each plant will be able to tailor fit solutions that meet their needs. No compromises.

Attend the Millennium Power Services presentation at 2014 501F Users Group Annual Conference. We're confident our industry-leading solutions will power your plant forward well into the future.
